How to use the Client Tools

The @freeXRI client tools allow you to query XRIs for various kinds of information. Think of them as the XRI equivalent to traditional networking tools such as Ping or Traceroute.

Our client tools work with any XRIs. They need not be hosted at our site. Simply enter an XRI, set parameters, and get your results.

XRI Inspector

The XRI Inspectors gives you general syntax information about an XRI. It displays the authority, path, query, fragment and normalized forms.

XRI Ping

XRI Ping may be used for a quick check.

It tells you if an XRI is valid and to what URI(s) it resolves.

XRI Resolution

XRI Resolution gives you full control over the resolution process. You can specify what kind of results you want and in which format.

XRI Traceroute

During XRI resolution, multiple different servers may be involved. XRI Traceroute displays every single step of an XRI resolution process.

Plus: Google Gadget, Desktop Tool
